The latest build can be downloaded at Github: The present invention relates to an optical repeater and an optical amplification system that repeat an optical signal. Generally, in an optical transmission system in a long-distance, large-capacity optical communication, an optical repeater (repeating device) with a function to repeat an optical signal having passed through an optical transmission line and an optical amplification device for compensating for loss in transmission lines are connected to each other, thereby repeating transmission lines. In the conventional technology, optical repeaters and optical amplification devices are connected and provided to a single or plural optical transmission systems. In the optical amplification device and the optical repeater in such an optical transmission system, optical amplification of an optical signal in transmission lines is repeated and the optical signal is repeated while being amplified to a required signal level, so that transmission of an optical signal in the optical transmission system becomes possible. In the optical transmission system, an in-line amplifier type
