Despite a low cost and high reactivity, the physical and chemical properties of acetylene-based polymers limit their applications. Chemical modification in the polymerization domain is a possible solution to this problem, since it can accelerate the reaction and improve the polymer properties. To accomplish this, different modifications of acetylene-based polymers with the addition of vinyl monomers have been studied. Alkyl acetylenes were synthesized with a Mitsunobu reaction, the number of carbons varying from five to twelve, and the reaction was combined with methyl methacrylate. The addition of alkyl groups improves the thermal stability of the polymers, with the maximum improvement being observed in the polymer with twelve carbons. These alkyl esters of acetylene are valuable monomers for preparing novel polymers.Efficacy and safety of the beta3-adrenoceptor agonist BRL37344 in patients with type 2 diabetes: an open-label, multiple-dose, dose-escalation trial. The purpose of this study was to evaluate the efficacy and safety of the beta(3)-adrenoceptor agonist BRL37344, an orally active, reversible, selective agonist of the human beta(3)-adrenoceptor, in patients with type 2 diabetes. Five single-blind, placebo-controlled, four-period, multiple-dose, dose-escalation trials were performed in 91 patients with

'WTF' turns \$1.2m landmark in New Orleans into an iPhone in-store - rkudeshi ===== alaskamiller "WTF" is already the technical term for "wave goodbye forever." Unified thatching truss The Unified thatched truss (also referred to as the "square thatched truss") is a type of internal thatched truss designed in the 1930s for use in housing for the middle class. These buildings were common in cities such as New York City and Indianapolis during this time. The design is a moveable truss which allows for placement in a tight space, making it appropriate for use in small apartment buildings and townhouses. History The truss's creator, Robert Randolph Falconer, had a long history with thatch. Falconer had been a

thatcher before studying physics and engineering at Columbia University in New York City. In 1929 he took a job as a thatcher for the New York City Housing Authority. While working on structures using thatch, Falconer noticed that it was very difficult to put up a truss using a design based on traditional thatching techniques. As thatch is not tensioned, the thatch that covers a truss must grow under the center spans of the truss in order to hold the truss in place. Since thatch cannot easily be tensioned, the truss structure relies on a wooden inter-joint connector (sometimes called a "splice") that can provide a little bit of tension and add flexibility to the 6d1f23a050
